

*Smile, laugh, frown, and make all the facial expressions you want and stop worrying about wrinkles!*

After years of squinting, laughing, frowning, smoking, and worrying, the skin around the eyes and on the forehead will often develop deep lines and wrinkles called "expression lines." A frequent concern is that they often make you look older, tired, or stressed. Until recently, these advanced furrows have been difficult to treat. Now, by utilizing this FDA approved muscle-relaxing agent, expression lines can be significantly reduced.

*"My friends comment on how much younger and more refreshed I look!"*

*D. Baldwin*

*How long does a BOTOX® treatment last?*

The effects usually last 3 to 4 months, and fade away gradually. Following several treatments, the results may last 4 to 8 months or longer. BOTOX® offers extended relief over the course of long-term treatment.

*Are there any possible side effects?*

Side effects of BOTOX®, if any, are usually mild and temporary. Botulinum toxins contain proteins, which in some circumstances may be naturally safeguarded against by the body's ability to produce antibodies. If antibodies are formed, the therapy will generate a lesser response. Temporary bruising is sometimes experienced, though this symptom resolves itself within 2 to 3 days. In rare cases, there can be a slight drooping of an eyelid or asymmetry of expression. If this should happen, return to your physician.

*What type of results will I see?*

Typically, the effect of BOTOX® is visible within 3 days. Maximum benefits are reached between 10 to 14 days. Once the muscle becomes dormant and the skin softens, you will have a more relaxed and youthful appearance. BOTOX® treatments are not a substitute for the results achieved with a facelift. The optimum appearance may be achieved with BOTOX® therapy in conjunction with a facelift, laser resurfacing, and skin rejuvenation.
