

An Intense Pulsed Light (IPL) therapy approach to eliminating unwanted hair provides the ultimate treatment solution, "PhotoEpilation." Unlike many other treatment methods, PhotoEpilation leaves your skin looking and feeling smoother and softer.

"I no longer have to shave, tweeze, pluck, wax, or suffer from ingrown hair! I feel liberated!"

M. J. Miller

How does PhotoEpilation work?

Without damaging the surrounding skin, controlled flashes of light penetrate the skin and are absorbed by the hair follicles. The heat damages or destroys the potential for regrowth. Because of the significantly large spot size created by this unique technology, backs, shoulders, abdomens and legs can be treated quickly. Facial areas such as the lip, chin, and beard, can be treated in minutes.

Who are candidates for treatment?

Men, women, and children may be treated with IPL. Treatments can be customized according to your hair color, texture, and body location. Hair of any color – black, brown, and red – can be treated. Treatment is effective on all skin types, including dark-skinned individuals of all ethnic origins. To find out if you are a candidate, ask to schedule a consultation.
