

## What does the procedure involve?

A surgical Neck Lift procedure involves creating an incision behind the ear, slightly into the ear, or a small incision under the chin. The skin is separated from the fat and the muscle below and the underlying fat is either trimmed or liposuctioned to obtain an improved, more sharply defined neck contour. If necessary, the platysma (muscle in the neck) will be tightened to treat the bands in the central neck. Incisions are placed so that the scars are minimal and hidden, and these scars will fade in time to become scarcely visible. This technique creates a more youthful, natural looking, and contoured neck.

*"Even after losing weight, my neck was not attractive. Since my procedure, I am so comfortable wearing my hair up and wearing clothing that shows off my new look!"*

*K Harris, age 51*

## What can I expect following the procedure?

- Recovery time varies and will depend on your individual healing rate.
- You may experience areas of numbness, which diminish in time.
- Bandages are worn for several days and stitches are removed in 5 to 10 days.
- Nominal swelling and bruising may occur but will fade and subside in 7 to 10 days.
- Many patients return to work in 1 to 2 weeks.

## What kind of risks are involved?

The Neck Lift and Liposuction procedures are both considered safe and are performed on thousands of men and women each year with no major complications. As with any surgical procedure, there are some risks. During a personal consultation, your surgeon can detail these for you.

During your consultation, your expectations will be discussed and your individualized treatment will be determined.
